

Prevent and Resolve IT Incidents With AIOps

AIOps to ensure an uninterrupted customer experience

Loom Systems delivers an AIOps solution to **predict and prevent IT incidents** in businesses undergoing a digital transformation or cloud migration.

Loom supports modern organizations in replacing a broad range of manual IT processes within incident response using AIOps to make ITOps faster and less costly, while reducing the skill set needed from operators.

Loom's AIOps intelligence, Sophie, stands in the industry as the only solution that predicts IT issues before they impact customers, and **provides resolutions in plain English**.

In a nutshell, Sophie:

- Uses AI to understand your logs automatically and continuously.
- Predicts IT incidents and alerts you before they impact your business.
- Provides insights and recommended actions on how to fix IT incidents.

"Loom systems is our first line of defense in assessing if something is impacting the application."
